Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Polymerase enhancing factor proteins, extracts and complexes -improve the polymerisation activity of nucleic acid polymerases, for use in amplification, sequencing and replication

οy Q

```
This is the amino acid sequence of the P45 component of the polymerase enhancing factor (PEF) of Pyrococcus furiosus DSM 3638.

The sequence is predicted from a DNA sequence (see AAW67860) obtained from genomic DNA by PCR. P45 and P50 (see AAW72844) are the predominant components of PEF, which acts to enhance the activity of the furiosus DNA polymerase. P45 functions as a durpase, and can be tactions. The invention provides novel extracts, proteins and complexes that improve the polymerisation activity of nucleic acid replication, provided snowel extracts, proteins and complexes that improve the polymerisation activity of nucleic acid for included are methods for identifying compositions with PEF activity, for purifying and using these compositions, and specific extracts, proteins and complexes that function to enhance polymerase activity. Nucleic acid polymerase reactions can be enhanced (claimed) by mixing a nucleic acid template, at least I polymerase and a composition having polymerase enhancing activity. Kits are provided for replicating nucleic acids enhancing activity. Kits are provided for replicating nucleic acids sequencing or amplification (preferably PCR or RT-PCR).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Secreted protein; gene therapy; cancer; tumor; fetal deficiency; neurodegenerative disorder; developmental abnormality; blood disorder; immune system disease; autoimmune disease; leukemia; inflammation; allergy; Alzheimer's disease; cognitive disorder; schizophrenia; obesity; osteoporosis; arthritis; infection, AIDS; diabetes; asthma; connective tissue disorder; transplant rejection; sepsis; acne; psoriasis; cardiovascular disorder; reproductive disorder; food additive; food preservative; storage capability.

                                                      This is the uridine-binding motif of the P45 component (see
AWA7281) of the polymerase enhancing factor (PEF) of Pyrococcus
furiosus DSM 3638. P45 has been identified as a duTpase that
the polymerase enhancing activity.
Sequences are provided (see
AWA72849-57) of the uridine-binding motifs of duTpases and dCTP
deaminases of P. furiosus, Methanococcus jannaschii, Desulfurolobus
ambivalans, Escherichia coli, yasat, human and herpesvirus; a
consensus (see AAW7284) is also provided. A claimed method of
the reaction in the presence of one or more of the following:
the reaction in the presence of one or more of the following:
a dUTPase, a protein that turns-over dUTP and a protein
having one or more of the sequences provided for replicating
claimed protein having DEF activity comprises one or more of
sequences given in AMY2848-57. A
claimed protein having DEF activity Comprises one or more of
claimed protein for Site-directed mutagenesis, for neglicating
cucled acids, for site-directed mutagenesis, for neglicating
sequencing or for amplification (preferably PCR or RT-PCR).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Polymerase enhancing factor proteins, extracts and complexes -
improve the polymerisation activity of nucleic acid polymerases, for
use in amplification, sequencing and replication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Polymerase enhancing factor; PEF; dUTPase; DNA polymerase; PCR; amplification; sequencing; replication.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          \times 0 0 \times                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       δ
                                                                                                                                      AAY40001-92 are derived from human secreted proteins. The polynucleotides and their corresponding secreted polypeptides are useful for preventing, treating or ameliorating medical conditions, e.g. by protein or gene therapy. Pathological conditions can also be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the polynucleotide. Specific uses include developing products for the diagnosis or treatment of cancer, tumors, neurodegenerative disorders, developmental abnormalities and fetal deficiencies, blood disorders, sepsis, diseases of the immune system, autoimmune diseases, inflammation, allergies, Alzheimer's and cognitive disorders, schizophrenia, obesity, osteoporosis, arthritis, diabetes, asthma, sepsis, acne, psoriasis, cardiovascular disorders, and reproductive disorders. The polypeptides or polynucleotides can also be used as food additives or preservatives, such as to increase or decrease storage capabilities, fat content, libid, protein, caraconders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; novel protein; Antianaemic; osteopathic; antiinflammatory; immunomodulatory; cytostatic; neuroprotective; vulnerary; nootropic; antiantanti antianthritic; cerebroprotective; antifungal; antiviral; antibacterial; antiallergic; dermaclogicial; haemostatic; antiasthmatic; thrombolytic; immunogen; antibody; gene therapy; neurological disorder; Parkinson's disease; inflammatory disorder; cancer; asthma; osteoporosis;

The invention relates to polynucleotides encoding novel human proteins or their active domains. The polypeptides, polynucleotides and antibodies raised against the polypeptides are used in a method of reatment of a mammal and prevention of disorders caused by the aberrant protein expression or activity. The polypeptides can be used as molecular weight markers, food supplements, and in antibody production. The polypeptides are used to identify compounds which bind to the polypeptides Polynucleotides of the invention are used as probes and production of recombinant proteins, and in generating anti-sense DNA or RNA and in gene therapy. Polypeptides of the invention can be used to target drugs to a tumnour, in assays to determine biological activity, to raise antibodies/elicit an immune response, to determine quantitative protein levels, as tissue markers, and to isolate receptors or ligands. Polypeptides of the invention may also be useful in treating platelet disorders, stem cell disorders, wound healing, treating burns, promoting the proliferation, differentiation and survival of stem cells, as a contraceptive, treating osteopoxosis and osteoarthritis, anaemia, and and many and survival of stem cells, as a contraceptive treating osteopoxosis and osteoarthritis, anaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

Porphorymonas gingivals (PG) polypeptide sequences given in AAY34318 to AAY34583. AAX91802 to AAX9199 polypeptide sequences given in AAY34318 to AAY34583. AAX91802 to AAX91989 represent PCR primers used in the isolation of the PG polypeptides. The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used as vaccines especially against Porphorymonas gingivalis. Probes can be used to detect Porphorymonas gingivalis in standard hybridisation assays. Porphorymonas gingivalis is involved in periodontal disease especially gingivitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAX91536 to AAX91801 encode two hundred and sixty six antigenic

                                                                                                                                                  A polypeptide (AAM18311) comprises rabbit complement C9. Chimeric proteins were constructed in which the segment of C9 corresponding to the putative CD59 binding site were interchanged between rabbit and human C9 (see also AAW18310). These were tested for haemolytic substn. of human C9 residues 334-415 into rabbit C9 resulted in a protein that was indistinguishable from human C9 is its sensitivity to inhibition by membrane CD59 in a protein that was indistinguishable from human C9 in its sensitivity to inhibition by CD59. When this same segment of human C9 was replaced by the corresponding rabbit sequence (a339-424), the unaffected by the presence of membrane CD59.

The invention relates to methods and compositions for screening, diagnosis and prognosis of Schizophrenia. The method involves detecting the presence of Schizophrenia. The method involves detecting the presence of Schizophrenia. The method scalares (SFS) and SCH. Associated Protein isoforms (SPIS) in samples, e.g. by electrophoresis, immunoassay or hybridisation assay, for diagnosing and monitoring SCH, studying the effectiveness of treatments and for identifying potential therapeutic agents. The method is used for (1) screening or diagnosis of SCH and the relative abundance of at least 1 chosen feature correlates with the presence or absence of SCH; and (2) monitoring the effect of the nearly administered to a subject with SCH and the relative abundance of at least 1 chosen feature which correlates with the severity of SCH. The expression and activity of the SFS, SFIS and related molecules (e.g. secondary messengers) are studied to diagnose SCH, monitor the program of the discrete for the severity for the secondary messengers are studied to diagnose SCH, monitor the correlates of treatment and as a secondary messengers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
AAY34583. AAX91802 to AAX91989 represent PCR primers used in the isolation of the PG polypeptides. The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used as vaccines especially against Porphorymonas gingivalis. Probes can be used to detect Porphorymonas gingivalis in standard hybridisation assays. Porphorymonas gingivalis is involved in periodontal disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Diagnosing and monitoring Schizophrenia by detecting the presence of Schizophrenia Associated Features and Schizophrenia Associated Protein Isoforms in samples of cerebrospinal fluid -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      targets to identify and produce potential therapeutic agents for the treatment of SCH. The paucity of detectable neuralgic defects distinguishes neuropsychiatric disorders such as SCH from neurological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Schizophrenia; neuroleptic; diagnostic; neuropsychiatric disorder;

These peptides are shortened to form fragments that contain one or more interaction sites of interest. AAR67104-105 are deriv. from moubatin. The dose is 1-4 micromoles. The peptides interact with specific receptors and inhibit tumour growth. The data collected demonstrates that interaction sites possess activity when present in a polypeptide that differs from the native form. Inclusion of conformation-constraining moieties can have desirable effects on an interaction site. (Also see AAR6701-101 and AAR67106-52 for analogues of other biologically active peptides contg. an interaction site flanked by conformation constraining gps., eg. RGD peptides.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   antiplatelet peptide; leech antiplatelet protein; collagen receptor; mimic; interaction site; constrained conformation; aggregation; moubatin.
disorders, where manifestations of anatomical and biochemical changes have been identified in many cases. Consequently the identification and characterisation of cellular and/or molecular causative defects and neuropathies are necessary for improved treatment of neuropsychiatric disorders. AAU15114 AAU15502 represent the amino acid sequences of schizophrenia-associated isoforms used in the method of the invention.
                                                                                                                                                                                                   Gaps

Nucleic acid encoding stereospecific nitrile hydratase and amidase also transformed cells expressing these enzymes, useful for conversion of racemic nitrile compounds to chiral amide(s) and acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Peptides (AAW17821-25) were obtd. by subjecting the purified nitrile hydratase alpha subunit (AAW17886) of Pseudomonas putida NRRL 18668 to cyanogen bromide, TPCK-treated trypsin and AspN protease digestions. Peptides (AAW17856-29) of the beta subunit (AAW17817) were also obtd. PCR primers (AAW17843-44) based on the peptides were used to amplify 18668 genomic DNA. A partial nitrile hydratase sequence (AAM56443-45) was obtd. and used as a probe to identify the full-length coding sequence (AAM56440).
                                                                                                                                                                                                         Nitrile hydratase; stereospecific enzyme; chiral compound; amide
                                                                                                                                                                           Nitrile hydratase alpha subunit partial sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is one of twenty overlapping peptides corresponding to the N-terminal 148 residues of the PrR27 adhesin from Porphyromonas gingivalis. Antibodies directed towards the Prt27 adhesin were found to provide protection against periodontitis in a human patient and found to immunoprotected mice. The peptides were used for epitope mapping of the PrR27 adhesin. Peptides comprising at least one P. gingivalis epitope particularly periodontitis, which is associated with P. gingivalis epitope particularly periodontitis, which is associated with P. gingivalis infection. They may lass be used to generate formulations protein specific and peptides are useful as immunogens in vaccine formulations protein specific and peptides per opticional or monoclonal antibodies. The peptides and antibodies against the peptides can be used in diagnostic tests to detect P. gingivalis infection. The antibodies can also be used in oral compositions such as toothpaste and mouthwash to neutralise the antigen and prevent disease.

derived from a library constructed to express peptides of the generic sequence AAM46623. The library was constructed using oligonucleotides AAV16118-20. The peptides contain a biotinylatable sequence motif, recognised by a biotinylation enzyme, e.g. biotini-protein ligase (BirA). The C or N terminus of the peptides can be covalently coupled to a protein that is incapable of being biotinylated by a biotin ligase. The peptides can be biotinylated in vitro or in vivo, especially with BirA biotin ligase, and used for the purification, immobilisation, labelling or detection of proteins.
                                                                                                                                         Peptides AAW46635-46 are non-naturally occurring biotinylation peptides,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a method for the identification and biotinylation of proteins synthesized by recombinant DNA techniques in vivo with a biotinylation peptide of less than 50 amino acids. The method comprises: (a) on the surface of a substrate, providing a fusion protein comprising a recombinant protein and a peptide defined by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Biotinylation enzyme; biotin-protein ligase; BirA; labelling;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                      A library of small, efficient peptide biotinylation sequences (AAR65032-46) was generated by using a generic peptide (AAR65020) and a system known as the 'peptides on plasmids" system. At some positions in the sequences, no clear consensus is apparent. At other residues, however, clear trends emerge. A protein can be biotinylated by constructing a recombinant DNA expression vector encoding a fusion protein, comprising a protein and a biotinylation peptide. A host cell, eg. E. coli is transformed with the vector and is cultured in the presence of biotin and a biotinylation enzyme, eg. BirA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon cancer associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. Nand P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing functive proteins or to supplement the patients on production of P. Addithonally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell
sequence given in AAY24492, where the peptide is capable of being blotinylated by a biotin ligase at the lysine residue adjacent to position 8 and is 13-50 as in length; (b) in a predefined region of the surface of the substrate, contacting the fusion protein with an enzyme; and (c) determining whether the fusion protein with an enzyme; the method allows the identification and purification of biotinylated enzymes e.g. BirA. The method is also useful in research and diagnostic applications. The method uses small but specific peptides, allowing the labelling of a protein at a defined site, this provides improved immobilization and avoids the use of antibodies. AAY2493 to AAY24548, and AAY2929 to AAY29312 represent specifically claimed examples of biotinylation peptides for use in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nucleic acids encoding 4277 human colon cancer-associated polypeptides, useful for preventing, diagnosing and/or treating colorectal cancers

Sequence 2, Application US/O8511485

Patent No. 591912

GENERAL INFORMATION:

APPLICANT: Mackenie, Alexander E.

APPLICANT: Baird, Stephen

TITLE OF INVENTION: MAMMALIAN IAP GENE FAMILY, PRIMERS,

TITLE OF INVENTION: PROBES, AND DETECTION METHODS

NUMBER OF SEQUENCES: 38

CORRESPONDENCE ADDRESS:

ADDRESSEE: Fish & Richardson P.C.

STREET: 225 Franklin Street

COUNTRY: BOSCON

STATE: MA

COUNTRY: BEADABLE FORM:

MEDIUM TYPE: FLOPDY disk

COMPUTER READABLE FORM:

MEDIUM TYPE: Patentin Release #1.0, Version #1.30

CURRENT APPLICATION NUMBER: 025/08/511,485

FILING SYSTEM: PAUG-1995

CURRENT APPLICATION NUMBER: 07540/002001

REFERENCE/DOCKET NUMBER: 07540/002001

                                                                                                                                                                                                                                                                                                                                                                                           0
                                                                                            The present sequence represents a cardiotonic peptide (I) derived from the brain of Octopus minor. Cardiotonic peptides of Mollusca of formula H-Gly.x.-Y-Asp-OH (I), where X = L-Ser, D-Ser, L-Phe or D-Phe and used for drugs and agricultural brain of octopus minor, can be used as cardiotonic agents and agricultural chancals. (I) have cardiant activity. (I) can be used as cardiotonic agents and agricultural chancals. The peptides are useful as blochemical reagents for neural transmission system and structure and activity relationship in the molecular level leading to development of drugs and agricultural chemicals.
New neuropeptides from brain of Octopus minor are used as cardiotonics

regions of internal similarity in bovine liver regions of internal similarity in bovine liver regions of internal similarity in bovine liver (glycosyl-phosphatidylinosito] (GPI) specific phosphalipase-D (AAR75109). The regions show homology with metal ion binding domains of integrin-alpha subunits, and share an Asp-rich core sequence (AAR75109). The regions show homology with metal ion binding domains of integrins on the core sequence matches the EF-hand consensus motif characteristic of calcium and magnesium binding proteins. The presence of these colometred to a heterologous gene linked at the 3'-end to a C-terminal photologous gene linked at the 3'-end to a C-terminal peptide (e.g. AAR75130) gene to form a GPI-anchored molecule, where the C-terminal peptide directs attachment of a GPI anchored in a vector for expression in a host cell. The enzyme inserted in a vector for expression in a host cell. The enzyme selectively hydrolyses the inositol-phosphate linkage of GPI-anchored proteins, GPI lipids and related molecules, resulting in direct construct may be secretion into the medium and simple recombinant protein purification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /note= "[3H]4-(Biotin-epsilon-NH(CH2)5CO-oxymethyl)-3-

```
peptide, which comprises the amino acid sequence (1) or (Ta):

X1-XX3-XX5-XX7-XX9-XXX12 (1): X5-X6-X7-X8-X9-X10-X11-X12 (Ta): where

X1 = Asp, Gln, Gly or Tyr; X = any amino acid; X3 = Asp, Asn, Thr or Glu;

X5 = Asp, Ser, Gly, Asn or Leu; X7 = Ala, Asp, Phe, Lys, Thr, Tyr, Arg,

Val, Cys or Ser; X9 = Asp, Glu, Gly, Seer, Thr, Met or Asn; and X12 =

Glu, Gln, Ala, Leu or Asn. (I) and (Ia) are neuroprotective calcium

binding peptides. (I) is used to treat a condition characterized by

cerebral ischaemia. (I) reduces the neurotaxic effect of cerebral

ischaemia. (I) is used to increase neuronal cell Ap-1 or NF-IL6

transport across the blood brain barrier into the brain or it can be

calcium. The peptide can be conjugated with a compound which facilitates

transport across the blood brain barrier into the brain or it can be

administered with a compound that increases transport across the blood

brain barrier. Molecules that protect neurons against the ischaemic

effects of stroke will also be useful for treating Alzheimer's disease,

as well as the memory deficits that are characteristic of the aging

process. The present sequence represents a specifically claimed example

of a neuroprotective calcium binding peptide from the present invention.
                                                                                                                        Neuroprotective peptides, which bind calcium, are useful for treating stroke and other neurodegenerative diseases \,\cdot\,
                                                                                                                                                                                                                                present invention describes a composition comprising an isolated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /note= "cystine, hydroxylysine, hydroxyproline"

                                                                                                                                                                                                                                                                                                                            compounds useful as affinity ligands for e.g. purifying substances are new, which comprise at least one carrier-binding site (CBS), egg.

biotin), at least one substance-binding site (CBS), and at least one biotoly, at least one substance-binding site (CBS), and at least one photolytically cleavable linkage (PCL) between a CBS and SBS. A spacer, a f-aminohexanoic acid gp. may be located between the CBS and SBS and the PCL is an o-nitrobenzyl ester linkage. AAR86325 peptide

(181]-BANA -CCK-88) is an affinity ligand for anti-CCK (cholecystokinin) antibodies. Biologically active substances can be isolated in pure form without damage to the substances by an "affinity chromatography" process in which the cpd. is incubated with a soln. of the target substance to form a complex; the complex is bound to a carrier through the CBS; the cubstance and a fragment of the cpd.; and the substance is recovered from this complex, e.g. by gel filtration, diaylsis or ultrafiltration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                             The sequences given in AAR24818-61 are new peptides which comprise at least 6 amino acids from the sequence given in AAR24814. The remaining amino acids are each Gly, Ala, Val, Lew, Ser, Thr. Cys. cystine, Met, Asp, Glu, Asn, Gln, Lys, hydroxylysine, His, Arg, Phe, TYr, Trp, Pro or hydroxyproline. These peptides used for the regulation of weight gain in mammals and can be used instead of amphetamine, which is largely used as an appetite suppressor. These peptides can also be used to prepare antibodies. Such antibodies can be used to attenuate the effect of the peptides in a host or to detect, quantify or purify the peptides.
                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                  New dodeca:peptide cpds. - used for regulating wt. gain in mammals or for producing antibodies for attenuating such effects

This is a consensus sequence of uridine-binding motifs of dUTPases and dCTP deaminases of Pyrococcus furiosus. Methanococcus of and address of Pyrococcus furiosus. Methanococcus of Jannaschii, Desulfurolobus ambivalens, Escherichia coli, yeast, human can herpesvirus (see AAM72850-57). A claimed method of enhancing and herpesvirus (see AAM72850-57). A claimed method of enhancing of nucleic acid polymerase reaction comprises performing the reaction in the presence of one or more of the following: a polymerase of the following: a polymerase a protein that turns-over dUTP and a protein selected from the sequences provided in AAW72848-57. A claimed protein having PEF activity comprises one or more of the sequences given in AAW72848-57. The invention provides novel extracts, proteins and complexes that improve the polymerisation activity of nucleic acid polymersses.

Also included are methods for identifying and using these compositions, and specific extracts, proteins and complexes that function to enhance polymerase activity. Kits are provided for replicating nucleic acids, for site-directed mutagenesis, for nucleic acids sequencing or for amplification (preferably PCR or PCR).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Polymerase enhancing factor proteins, extracts and complexes -
improve the polymerisation activity of nucleic acid polymerases, for
use in amplification, sequencing and replication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                   Screening for DNA encoding enzyme of interest, involves obtaining DNA from microorganism, selecting PCR primers, performing PCR and screening PCR products, or selecting a probe for use in Southern blot
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Starch biosynthesis; amyloplast; ADP-glucose; transport; import; amylopectin; amylose; branching; chemical structure; transgenic plant;
                                                                                                                                                                                                                                                                         AAG62871-77 represent conserved regions of Fam35-lactases. The specification describes a method for obtaining new Fam35-lactases of fungal origin. Primers designed from highly conserved regions of Fam35-lactases are used in the method of the invention. The Fam35-lactases are useful in the manufacture or processing of foodstuffs or feeds fit for consumption by lactose intolerant humans or animals. Fam35-lactases are also useful for treating lactose

This sequence represents a wheat amyloplast ADP-glucose transporter peptide, #5. The wheat amyloplast ADP-glucose transporter is associated with the amyloplast membrane and comprises at least two proteins; this sequence, along with peptides #4-#7 (AAY42756-Y42759) represent sequences within one of these proteins (AAY42756-Y42759) represent components of a second protein. The sugar nucleotide ADP-glucose is the immediate substrate for starch synthesis, which occurs in the amyloplast; however, ADP-glucose is mainly contributed the amyloplast in the cytoplasm. The ADP-glucose transporter is responsible for the import of ADP-glucose into the amyloplast and therefore plays a pivotal role in the regulation of starch camyloplasts. The transporter not only influences starch yield, but also quality as the starch synthases involved in amylose and amylopectin synthesis have different affinities for ADP-glucose. Variations in the chemical structure of starch are determined by the ratio of amylopectin camylopectin, and by the degree of branching in amylopectin in the starch committed the properties of transmission of starch and significantly alter the properties of transmission of starch and significantly alter the properties of transmission of starch and significantly alter the properties of transmission of starch and significantly alter the properties of transmission of starch and significantly alter the properties of transmission of starch and significantly alter the properties of transmission of starch and significantly alter the properties of transmission of starch and significantly alter the properties of transmission of starch and significantly alter the properties of transmission of starch and significantly alter the properties of transmission of starch and significantly alter the properties of transmission of starch and significantly alter the properties of transmission of starch and significantly alter the properties of transmission of starch and significantly alter the properties of transmission of starch and sig
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            transgenic plants in which the starch quality can be optimised for industrial applications in which starch is used. For example, transgenic plants which have an increased amylose content in starch are useful for production of starch with increased viscosity and gel strength, which prevents baked food going stale so quickly. Conversely, an increased amylopectin content in the starch produces waxy starch useful as thickening agents in food and coatings.
New transporter complex protein useful for modulating starch content in plants, especially useful in food production \cdot

AAW82023-W82240 are peptides used in the construction of a fluorogenic composition which is used for the detection of protease activity in biological samples. The products can be used for the detection of conformation changes in nucleic acids, oligosaccharides, and products can be used for the detection of polysaccharides, proteins, peptides, lipids, phopolipids, glycoproteins, steroids or polymers. In addition, attachment of a phycoproteins, steroids or polymers. In addition, attachment of a rhe composition is composed of P = peptide comprising a protease binding site for the protease, FI, F2 peptides = fluorophores where F1 is cartached to the amino terminal anno acid and F2 is attached to the artached and S1, S2 peptides = when present, are peptide spacers where S1, when present, is attached to the amino terminal and S2, when present, is attached to the amino terminal acid and S2, when present, is attached to the carboxyl terminal amino acid.
            Protease activity; fluorphore; detection; fluorogenic; cellular uptake;
conformation change.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New fluorogenic compositions - containing 2 fluorophores separated by a peptide comprising a protease binding site, used for detecting procease activity in samples.
                                                                                                                  /label- Alb
/note- "alpha-aminoisobutyric acid, labelled as
amino acid B in the specification"
                                                                                                                                                                                                                                                                                                                 "epsilon-aminocaproic acid, labelled as amino acid J in the specification"
                                                                                                                                                                               "epsilon-aminocaproic acid, labelled amino acid J in the specification"
                                                                                                                                                                                                                                                                     "epsilon-aminocaproic acid, labelled amino acid J in the specification"
                                                                                                                                                                                                                           "epsilon-aminocaproic acid, labelled amino acid J in the specification"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Peptides AAV39331-Y39337 are fragments of an ADP glucose transporter protein. The protein contains at least one of the peptide sequences, and is capable of ADP glucose transport. A DAM molecule encoding an ADP glucose transporter protein can be used to transform plant cells. The production from a plant. The plants can then be used to regulate starch production from a plant. The plants can then be used to produce waxy starches that can be used as thickening agents in food and coatings. Alternatively the plants can be used to produce a starch with increased viscosity and gel strength, which can be incorporated in baked food which stays fresh for a longer length of time.
                                                        ADP glucose transporter; transform plant cell; wheat; starch production; waxy starch; thickening agent; food; coating; increased viscosity; stale; gel strength; baked food.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAW82023-W82240 are peptides used in the construction of a fluorogenic composition which is used for the detection of protease activity in biological samples. The products can be used for the detection of conformation changes in nucleic acids, oligosaccharides, proteins, peptides, lipids, phopholipids, glycolipids, plycoproteins, steroids or polymers. In addition, attachment of a hydrophobic group to a molecule can be used to enhance uptake by cells. The composition is composed of P = peptide comprising a protease binding site for the protease, FI, F2 peptides = fluorophores where F1 is attached to the amino acid and F2 is attached to the artached to the amino acid and S1, S2 peptides = when present, are peptide spacers where S1, when present, is attached to the amino terminal amino acid, and S2, when present, is attached to the amino terminal acid, and S2, when present, is attached to the carboxyl terminal amino
                                                                                                                                    Protease activity; fluorphore; detection; fluorogenic; cellular uptake; conformation change.
                                                                                                                                                                                                                                                                                                                                                                                                                                                    "tetrahydroisoguinoline-3-carboxylic acid,

cancer-associated nucleic acid molecules (N) and proteins (P), where
the proteins are collectively known as colon cancer antigens. The colon
cancer antigens have cytostatic activity and can be used in gene
therapy and vaccine production. N and P may be used in the prevention,
diagnosis and treatment of diseases associated with inappropriate P
cepression. For example, N and P may be used to treat disorders
associated with decreased expression by rectifying mutations or deletions
in a patient's genome that affect the activity of P by expressing
in a patient's genome that affect the activity of P by expressing
the proteins or to supplement the patients own production of P.
Additionally, N may be used to produce the colon cancer-associated Ps,
by inserting the nucleic acids into a host cell and culturing the cell
to express the proteins. N and P can be used in the prevention, diagnosis
and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204

                                                                                                                                                                                                                                                                                                                                                                                                12-APR-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                         05-OCT-1999
 AAB81828;
The present invention describes fluorogenic compositions which can be used for the detection of protease activity. This can be useful as an indicator of viral infection, cancer metastasis, haemophilia, emphysema, thrombosis and arthritis. The fluorogenic compositions comprise a peptide, a peptide spacer and a donor and an acceptor fluorophore. The peptide is cleaved by a protease and the fluorophores can then be detected. The present sequence is one of the peptides described in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                           New fluorogenic compositions whose fluorescence level increases in the presence of active protesses, useful for detecting and localizing protesses activity in biological samples, particularly in frozen tissue samples.
                                                                                                                        Protease detection; peptide cleavage; enzyme activity; fluorogenic; viral infection; cancer metastasis; emphysema; arthritis; thrombosis; haempphilas

```
The present invention provides the protein and coding sequences of 10 endozepine-like proteins, designated BNDOL-ENDOLO. The sequences are useful in the treatment of various diseases, including obesity, metabolic disorders, diabetes, infections, anorexia, syndrome X, cancer-associated cachexia and dyslipidaemlas. The present sequence is a protein fragment of the invention.
                                                                                                                                                                                                                                              Novel human endozepine-like polypeptide, polynucleotide for diagnosis, prevention, treatment of diabetes, metabolic disturbances associated with obssity, anorexia, cancer, dyslipidaemia and for identifying modulators

The present invention provides the protein and coding sequences of 10 endozepine-like proteins, designated ENDO1-ENDO10. The sequences are useful in the treatment of various diseases, including obesity, metabolic disorders, diabetes, infections, anorexia, syndrome X, cancer-associated cachexia and dyslipidaemias. The present sequence is a protein fragment of the invention.
                                                                                                                     Novel human endozepine-like polypeptide, polynucleotide for diagnosis, prevention, treatment of diabetes, metabolic disturbances associated with obesity, anorexia, cancer, dyslipidaemia and for identifying
